Querying surface attributes

Both grids and Tins can be queried to examine their surface attributes. If you query a grid theme, the cell value for the selected location will be returned. If you query a TIN theme, the elevation, slope, and aspect for the location will be returned. Any attribute value assigned to the TIN triangle encompassing the selected location will also be listed.

What type of surface do you wish to explore?

» Examining the cell values in a grid theme

» Querying elevation, slope, and aspect in a TIN theme
