

## Analyzing visibility

The two types of visibility analysis are line of sight and viewshed analysis. Line of sight tells you whether a given target is visible from a particular point of observation. It answers the question, 'Can I see that from here?' Viewshed analysis identifies the areas on a surface that are visible from one or more observation points. It answers the question, 'What can I see from these locations?'

### What type of visibility analysis would you like to perform?
